Cervical spine surgery is generally performed on an elective basis to treat either: Nerve/spinal cord impingement (decompression surgery) Spinal instability (fusion surgery). The two procedures are often combined, as a decompression may de-stabilize the spine and create the need for a fusion to add stability.

### Age-Related Hyperkyphosis: Its Causes, Consequences, and ...

Seven cervical vertebrae, labeled C1 to C7, form the cervical spine from the base of the skull down to the top of the shoulders. At each level, the cervical vertebrae protect the spinal cord and work with muscles, tendons, ligaments, and joints to provide a combination of support, structure, and flexibility to the neck.
