Saturated vs. Unsaturated Fat: Know the Facts

All fats are built of carbons and hydrogens. Saturated fats are chains of

carbon atoms with as many hydrogen atoms on that chain as possible. The carbons are, literally, saturated. Because those carbon chains are so full with hydrogen atoms, the chains are stiffer, less flexible.

blocks of fat, and the more hydrogen than carbon that it has, the more saturated it is.

Saturated fats are usually solid at room temperature. (Think of bacon grease or a block of cheese.) The less hydrogen than carbon, the more liquid it is. (Think of canola or sunflower seed oil.)

Saturated fats consist of single bond whereas unsaturated fats consists of at least one double bond.

Saturated fats have no double bond between molecules, which means there are no gaps and the fat is saturated with hydrogen molecules.

Unsaturated fats contain at least one double bond in their fatty acid chain.
