fundamental personality trait. For example, in the Big Five approach to personality trait theory, individuals with high scores for neuroticism are more likely than average to be moody and to experience such feelings as anxiety, worry, fear, anger, frustration, envy, jealousy, guilt, depressed mood, and loneliness.

Neuroticism - Wikipedia

The mental status examination is a structured assessment of the patient's behavioral and cognitive functioning. It includes descriptions of the patient's appearance and general behavior, level of consciousness and attentiveness, motor and speech activity, mood and affect, thought and perception, attitude and insight, the reaction evoked in the examiner, and, finally, higher cognitive abilities.

An intervention is an important event, created by family and friends of a person struggling with addiction, to help the person realize they have a problem, they need help, and they have support. While reality television shows have popularized interventions in recent years, these depictions often offer a false sense of how an intervention should be conducted.
